

ENDOSCOPIC DEVICE FOR SPILL-PROOF LAPAROSCOPIC OVARIAN CYSTECTOMY

Abstract of the Disclosure

A endoscopic device for use in a laparoscopic surgical procedure such as a cystectomy is disclosed. An intact organ such as an ovary is encapsulated partially or completely with the endoscopic device while the organ remains attached to the body. By inserting instruments into the endoscopic device, a surgical procedure is then performed within the endoscopic device, for example, a cyst may be removed from an ovary. After cyst removal, the endoscopic device is irrigated to remove leakage before withdrawal of the cyst within the endoscopic device.
